WHO 2010 of digestive neoplasms

Table 1.03 Transition scheme for the new classification (WHO 2010) including previous definitions for neuroendocrine neoplasms of the digestive system (WHO 1980 and 2000).

WHO 1980	WHO 2000	WHO 2010
I Carcinoid	1. Well-differentiated endocrine tumour (WDET) ^a 2. Well-differentiated endocrine carcinoma (WDEC) ^b 3. Poorly differentiated endocrine carcinoma/small cell carcinoma (PDEC)	1. NET G1 (carcinoid) ^b 2. NET G2 ^b 3. NEC (large cell or small cell type) ^c
II Mucocarcinoid	4. Mixed exocrine-endocrine carcinoma (MEEC)	4. Mixed adenoneuroendocrine carcinoma (MANEC)
III Mixed forms carcinoid-adenocarcinoma		
IV Pseudotumour lesions	5. Tumour-like lesions (TLL)	5. Hyperplastic and preneoplastic lesions

{1106, 3013, 3516}

G, grade (for definition, see text); NEC, neuroendocrine carcinoma; NET, neuroendocrine tumour.

^a The difference between WDET and WDEC was defined according to staging features in the WHO 2000 classification. G2 NET does not necessarily translate into WDEC of the WHO 2000 classification.

^b Definition in parentheses for the International Classification of Diseases for Oncology (ICD-O) coding.

^c "NET G3" has been used for this category but is not advised, since NETs are by definition well-differentiated.

Tumore Neuroendocrino (NeuroEndocrine Tumor – NET)

Grading

G1

G2

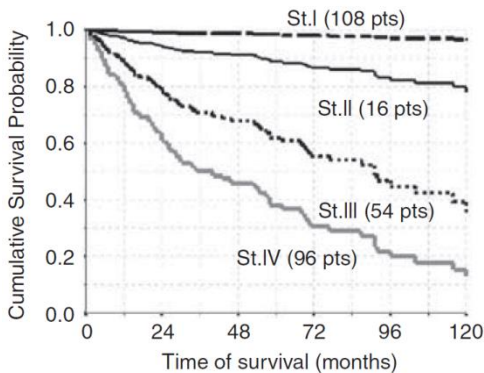

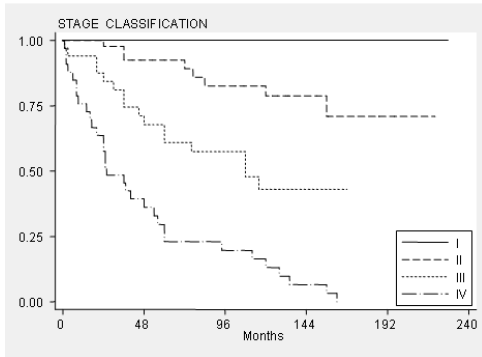

G3

	Mitoses	Ki67 index
G1	m < 2	Ki67 < 3%
G2	2 < m < 20	3% ≤ Ki67 ≤ 20%
G3	m > 20	Ki67 > 20%

Table 1 Proposal for a TNM classification and disease staging for gastric endocrine tumors

TNM	
T—primary tumor	
TX	Primary tumor cannot be assessed
T0	No evidence of primary tumor
Tis	In situ tumor/dysplasia (<0.5 mm)
T1	Tumor invades lamina propria or submucosa and ≤1 cm
<u>T2</u>	Tumor invades muscularis propria or <u>subserosa</u> or >1 cm
<u>T3</u>	<u>Tumor penetrates serosa</u>
T4	Tumor invades adjacent structures
	For any T, add (m) for multiple tumors
N—regional lymph nodes	
NX	Regional lymph nodes cannot be assessed
N0	No regional lymph node metastasis
N1	Regional lymph node metastasis
M—distant metastasis	
MX	Distant metastasis cannot be assessed
M0	No distant metastases
M1 ^a	Distant metastasis

TNM Clinical Classification-Stomach

T – Primary Tumour

- TX Primary tumour cannot be assessed
- T0 No evidence of primary tumour
- Tis Carcinoid in situ/dysplasia (tumour less than 0.5mm, confined to mucosa)
- T1 Tumour confined to mucosa and 0.5mm or more but no greater than 1cm in size; or invades submucosa and is no greater than 1 cm in greatest dimension
- T2 Tumour invades muscularis propria or is more than 1 cm in greatest dimension
- T3 Tumour invades subserosa
- T4 Tumour perforates visceral peritoneum (serosa) or other organs or adjacent structures

Note: For any T, add (m) for multiple tumours.

N – Regional Lymph Nodes

- NX Regional lymph nodes cannot be assessed
- N0 No regional lymph node metastasis
- N1 Regional lymph node metastasis

M – Distant Metastasis

- M0 No distant metastasis
- M1 Distant metastasis

Carcinoma neuroendocrino (NeuroEndocrine Carcinoma – NEC)

	Mitoses	Ki67 index
G1	m < 2	Ki67 < 3%
G2	2 < m < 20	3% ≤ Ki67 ≤ 20%
G3	m > 20	Ki67 > 20%

WHO Classification of Tumours of the Lung, Pleura, Thymus and Heart

Edited by
William D. Travis, Elisabeth Brambilla, Allen P. Burke, Alexander Marx, Andrew G. Nicholson

Table 1.17 Criteria for diagnosis of neuroendocrine tumours. Reprinted from Travis WD et al. (2678)

Typical carcinoid A tumour with carcinoid morphology and < 2 mitoses per 2 mm ² , lacking necrosis, and ≥ 0.5 cm
Atypical carcinoid A tumour with carcinoid morphology and 2–10 mitoses per 2 mm ² and/or necrosis (often punctuate) or both
Large cell neuroendocrine carcinoma 1. A tumour with a neuroendocrine morphology (organoid nesting, palisading, rosettes, trabeculae) 2. High mitotic rate: > 10 mitoses per 2 mm ² , median of 70 mitoses per 2 mm ² 3. Necrosis (often in large zones) 4. Cytological features of a non-small cell carcinoma: large cell size, low nuclear-to-cytoplasmic ratio, vesicular, coarse or fine chromatin, and/or frequent nucleoli; some tumours have fine nuclear chromatin and lack nucleoli, but qualify as non-small cell lung carcinoma because of large cell size and abundant cytoplasm 5. Positive immunohistochemical staining for one or more neuroendocrine markers (other than neuron-specific enolase) and/or neuroendocrine granules by electron microscopy.
Small cell carcinoma Small size (generally less than the diameter of 3 small resting lymphocytes) 1. Scant cytoplasm 2. Nuclei: finely granular nuclear chromatin, absent or faint nucleoli 3. High mitotic rate: > 10 mitoses per 2 mm ² , median of 80 mitoses per 2 mm ² 4. Frequent necrosis (often in large zones)

Table 1.16 Differential diagnosis of neuroendocrine tumours based on clinicopathological characteristics.

	Typical carcinoid	Atypical carcinoid	Large cell neuroendocrine carcinoma	Small cell lung carcinoma
Average age	Sixth decade	Sixth decade	Seventh decade	Seventh decade
Sex predominance	Female	Female	Male	Male
Smoking association	No	Variable*	Yes	Yes
Diagnostic criteria				
Mitoses per 2 mm ²	0–1	2–10	> 10 (median of 70)	> 10 (median of 80)
Necrosis	No	Focal, if any	Yes	Yes
Neuroendocrine morphology	Yes	Yes	Yes	Yes
Ki-67 proliferation index	Up to 5%	Up to 20%	40–80%	50–100%
TTF1 expression	Mostly negative	Mostly negative	Positive 50%	Positive 85%
Synaptophysin / chromogranin	Positive	Positive	Positive 80–90%	Positive 80–90%
CD56	Positive	Positive	Positive 80–90%	Positive 80–90%
Combined with a non-small cell lung carcinoma component	No	No	Sometimes	Sometimes

* The majority of carcinoid patients are never-smokers or light smokers, although atypical carcinoid is more associated with current or former smokers than typical carcinoid patients.
